

**ABSTRACT OF THE DISCLOSURE**

An apparatus for homogeneously distributing lights includes a light guide plate,  
5 an incidence microstructure and an emergence microstructure. The incidence  
microstructure is arranged on a surface of the light guide plate and opposite to a light  
source. The emergence microstructure is arranged on a surface of the light guide plate  
opposite to the incidence microstructure. The lights emitted by the light source pass  
through said apparatus thereby being homogenously distributed. Thus the manufacture  
10 costs are lowered, and the light source utilization ratio is increased.
